

SkillBridge AI Workflow

System Architecture & Platform Flow (SIH26044)

1. Profile Creation & Data Ingestion

Students input data, upload resumes, and certificates. System uses NLP to extract key skills and build a baseline digital "Skill Passport".

2. Skill Assessment & Evidence

Candidates take domain-specific assessments and submit project URLs. The platform verifies proficiency levels against claimed skills.

3. AI Gap Analysis

The recommendation engine compares the user's current verified skills against industry-defined competency matrices for their target roles.

4. Personalized Learning Roadmaps

Based on identified gaps, the platform suggests customized learning pathways, including specific courses, practice tests, and micro-projects.

5. Explainable Opportunity Matching

System matches "ready" profiles with active internships and jobs. It provides an "Explainable Score" showing exactly why a candidate is a good fit.

6. Tracking & Analytics

Role-based dashboards update in real-time. Institutions track placement readiness, while students track application progress and skill growth.
